## 技术规格

Background:	This gene encodes a member of the highly conserved amyloid precursor protein gene family. The encoded pr otein is a membrane-associated glycoprotein that is cle aved by secretases in a manner similar to amyloid beta A4 precursor protein cleavage. This cleavage liberates a n intracellular cytoplasmic fragment that may act as a transcriptional activator. The encoded protein may also play a role in synaptic maturation during cortical devel opment. Alternatively spliced transcript variants encodin g different isoforms have been described.
