技术规格

Background:	Decapping is a key step in general and regulated mRNA decay. The protein encoded by this gene is a decapping enzyme. This protein and another decapping enzyme form a decapping complex, which interacts with the nonsense-mediated decay factor hUpf1 and may be recruited to mRNAs containing premature termination codons. This protein also participates in the TGF-beta signaling pathway. Alternative splicing of this gene results in multiple transcript variants.
Applications:	ELISA, IHC
Name of antibody:	DCP1A
Immunogen:	Fusion protein of human DCP1A

Full name:	decapping mRNA 1A

SwissProt:	Q9NPI6
ELISA Recommended dilution:	2000-10000
IHC positive control:	Human cervical cancer and human colon cancer
IHC Recommend dilution:	100-300
