## 技术规格

Background:	This gene encodes a DNA topoisomerase, an enzym e that controls and alters the topologic states of DN A during transcription. This enzyme catalyzes the tra nsient breaking and rejoining of a single strand of D NA which allows the strands to pass through one a nother, thus relaxing the supercoils and altering the topology of DNA. The enzyme interacts with DNA h elicase SGS1 and plays a role in DNA recombination,
	elicase SGS1 and plays a role in DNA recombination, cellular aging and maintenance of genome stability.
